Dehydration, fatigue, muscle cramping, extreme sweating, hyperthermia

LONG TERM EFFECTS

Brain

Long-term memory loss, brain damage

Psychological

Depression, addiction

Heart

Heart attack, blood vessel constriction

Liver

Liver Damage

Kidney

Kidney Damage

Stomach

Diarrhea

Physical

Insomnia, Body aches, fatigue

STREET NAMES FOR MOLLY:

Ecstasy, Legal E, Legal X or A2 .

SO, WHAT IS THE DIFFERENCE BETWEEN MOLLY AND ECSTASY?

The most obvious difference is their physical form: Molly is a white powder or crystal-like substance and ecstasy is used to describe the pill or capsule form of MDMA.

FACTS ABOUT MOLLY:

- Molly is a Schedule I type drug, which makes it illegal.
- Molly is NOT a safe alternative to Ecstasy.
- Molly IS addictive.
- Molly has been known to make people sick and has also been blamed for the deaths of some users.
- Often times, molly is cut with other drugs including cocaine or amphetamines, which makes it even more dangerous.
- Molly pills are often imprinted with logos, symbols or letters.
- Common with molly usage is accidental overdose. Users often take several doses to achieve the hallucinogenic high they are expecting.
- After the high from molly wears off, the chemicals in the drug often cause devastating depression.

Refusal Tips

Dealers thrive on your lack of knowledge of MDMA, saying things like, "It's not like other drugs. This one's safe," and "It's not addictive. Just try it out tonight, and you'll be fine." When you hear this, be polite, say "no thanks," and walk away. Simple as that.

But if a friend or someone you know offers you a drug at a party, try one of these:

- "Nah, that's OK. I heard that stuff gives you the chills."
- "I'm good. I'm already having fun."
- "No thanks, I just want to remember the night."
